

TECHNICAL BULLETIN

FOR TARGET MARKET ROOFING

BUILDING TRUST

Subject: Sno Gem® Products with Sika Sarnafil Roofs

1/1

Effective immediately, Sno Gem's PVC-coated bar snow retention systems (collectively the "Sno Gem Components") can be used in connection with Sika Sarnafil roofing systems, subject to the following conditions:

- The baseplates of the Sno Gem Components must be coated with the liquid PVC coating;
- Any other membrane portion of the Sno Gem Components, including, without limitation, the target patch, must be made entirely of Sika Sarnafil PVC membrane;
- Sika Sarnafil standard welding techniques must be used and requirements met in connection with the installation of the Sno Gem Components;
- The Sno Gem Components must be installed by a Sika Sarnafil authorized applicator (must be the original applicator unless approved in advance in writing by Sika Sarnafil) in strict conformance with all of Sika Sarnafil's installation guidelines and requirements, including, without limitation, its pre- and post-installation inspection requirements, in effect at the time of the installation.

Failure to meet any of the foregoing conditions will void the Sika Sarnafil Roof Warranty on the project or, in the case of a new installation project, preclude the issuance of a Sika Sarnafil Roof Warranty for the project.

Installation of Sno Gem Components and the attachment of Sno Gem Components to the Sika Sarnafil roofing system, will not void any Sika Sarnafil Roof Warranty in effect on a given roofing system, or prevent the issuance of a Sika Sarnafil Roof Warranty for a given roof system project provided the conditions were met above.

We will NOT be selling the Sno-Gem components through Sika Corp. – Roofing.

Please contact the Technical Department should you have any questions.
